MONITORIZAÇÃO DE LEPIDÓPTEROS
ANO 2014

Paula Banza

A PORTUGAL ROCHA
Crer, Cuidar e Transformar

1. Introdução

Este relatório mostra os resultados da captura de Lepidópteros durante 2014 nos jardins da sede da Associação A Rocha, em 6 localizações no Sítio Natura da Ria de Alvor e ainda na Praia de Cabanas Velhas – Ponta de Almádena.

Foram realizadas 55 sessões de captura ao longo do ano, normalmente uma vez por semana. Devido a um problema técnico, a armadilha do tipo skinner com lâmpada de vapor de mercúrio utilizada nos jardins da Cruzinha, foi substituída por uma armadilha portátil com lâmpada UV (ultra violeta) entre os meses de Janeiro a Outubro; este tipo de armadilha foi também utilizado nos restantes locais.

Além da responsável, também estiveram envolvidos nas capturas e identificação das borboletas dois voluntários da Rocha, Todd Jenkins e Ben Porter.

O principal objectivo deste trabalho é conhecer a diversidade, abundância e distribuição das borboletas nocturnas nalguns habitats do Algarve.

No total foram capturadas cerca de **4437** borboletas, de **311** espécies pertencentes a **30** famílias. A maior parte foram identificadas ao nível da espécie mas nalguns casos só até ao nível do género.

2. Localização das armadilhas

Na **tabela 1** estão registadas as coordenadas geográficas dos locais de colocação das armadilhas.

4. Resultados

No geral houve uma diminuição do número de indivíduos capturados, o que provavelmente está relacionado com a alteração do tipo de lâmpada; com as lâmpadas de vapor de mercúrio registam-se maiores números do que com as lâmpadas UV (obs. pessoal).

Das espécies capturadas salientam-se alguns primeiros registos: ***Dryobotes monochroma***, ***Dryobotes robonis***, ***Dysspastus fallax***, ***Notocelia cynosbatella***, ***Odites kollarella***, ***Oegoconia caradjai***, ***Oria musculosa***, ***Schrankia costaestrigalis Smerinthus ocellata***. e o género ***Stathmopodidae sp***.

Relativamente a segundos registos temos: ***Acroclita subsequana*** (1º registo em 2011), ***Ammopolia witzenmanni*** (1º registo em 2011), ***Cleonymia diffluens*** (1º registo em 2011), ***Eremopola orana*** (1º registo em 2009), ***Gortyna xanthenes*** (1º registo em 2012), ***Hodobertia testalis*** (1º registo em 2010), ***Lycia hirtaria*** (1º registo em 2011), ***Lygephila craccae*** (1º registo em 2011) e ***Oiketicoides eganai*** (1º registo em 2011).

As espécies mais abundantes foram *Lamoria anella*, *Eilema caniola e Ethmia bipunctella*, por esta ordem.

O **Quadro 1** representa um resumo das capturas e do número de espécies e indivíduos capturados em cada um dos locais de estudo.
